1. Objective

This document describes the Deployment Details of AI-powered Rasa Chatbot. It focuses on building the necessary Docker images, composing the network, and creating containers. This document is meant for the Software Developer and Maintenance Team members.

1.1 About Rasa Chatbot

The AI-Powered Rasa Chatbot makes use of two services/servers, specifically Rasa Server and the Action Server. Docker Compose allows us to run both of the servers simultaneously while interacting with each other, maintain the chat history in the container, expose the host over API, and many other operations.

2. Prerequisites

Docker (version 18 or above) and Docker Compose must be installed on the Server/VM.

- To check Docker version: docker --version
- o To check docker-compose version: docker-compose --version

```
[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$
[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$
[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$ sudo docker --version

Docker version 19.03.6, build 369ce74a3c
[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$ sudo docker-compose --version

docker-compose version 1.23.2, build 1110ad01
[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$

[rohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance chatbot]$
```

3. How to get started

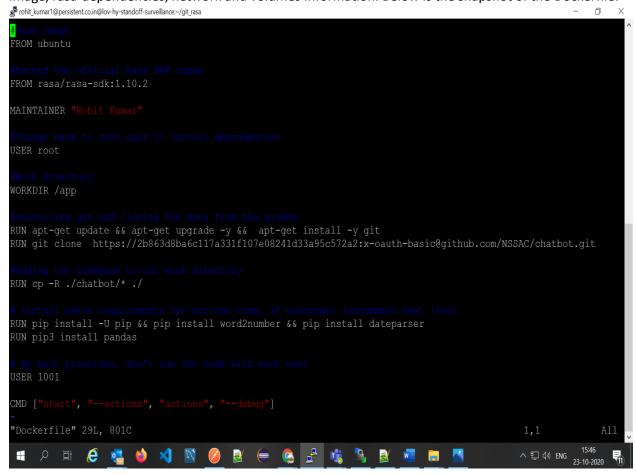

This section covers the steps needed to create the Compose network, set up both servers, and set up the intercommunication between them.

3.1 Clone the Repository

Clone the repository from the GitHub: **git clone** https://github.com/NSSAC/chatbot.git .In order to clone you must have the access to the NSSAC/chatbot repository.

```
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance awe]$ git clone https://github.com/NSSAC/chatbot.git
Cloning into 'chatbot'...
Username for 'https://github.com': rohit-persistent
Password for 'https://rohit-persistent@github.com':
remote: Enumerating objects: 2095, done.
remote: Counting objects: 100% (2095/2095), done.
remote: Compressing objects: 100% (1763/1763), done.
remote: Total 2095 (delta 337), reused 2072 (delta 324), pack-reused 0
Receiving objects: 100% (2095/2095), 43.68 MiB | 9.59 MiB/s, done.
Resolving deltas: 100% (337/337), done.
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance awe]$ cd chatbot/
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance chatbot]$
```

The cloned repository will have Dockerfile and docker-compose.yml file which contains all the rasa image, rasa-dependencies, network and volumes information. Below is the snapshot of the Dockerfile:

docker-compose.yml file is responsible for the internal port mappings, creating a compose network for both action and rasa server, and the volumes information.

Below is the snapshot of the docker-compose.yml file:

Prohit_kumar1@persistent.co.in@lov-hy-standoff-surveillance:~/awe/chatbot

```
version: '3.0'
services:
  rasa:
    image: rasa/rasa:1.10.11-full
    ports:
      - 5005:5005
    volumes:
      - ./:/app
    command:
      - run
      - --enable-api
      - --endpoints
      - endpoints.yml
      - --cors
  app:
    image: rasa/rasa-action-server
    volumes:
      - ./actions:/app/actions
    ports:
      - 5055:5055
"docker-compose.yml" 23L, 358C
    \mathcal{Q}
        Ϊį
```

3.2 Actions after cloning the repository

- Go to the cloned directory 'chatbot' where Dockerfile and docker-compose.yml file exists
- Run docker build -t rasa/rasa-action-server . at the level where the Dockerfile exists. It will create a custom rasa action server image. The name of the image must be rasa/rasa-action-server or, if you want a custom image name, you also need to change the image name in the docker-compose.yml file. You can see the images by running the docker images command.
- As in the snapshot below, rasa/rasa-action-server is our image.

[rohit kumarl@persistent.co.in@lov-hy-standoff-surveillance chatbot]\$ sudo docker images							
REPOSITORY	TAG	IMAGE ID	CREATED	SIZE			
rasa/rasa-action-server	latest	ec7eb136852a	About a minute ago	707MB			
python	latest	28a4c88cdbbf	2 weeks ago	882MB			
rasa/rasa	1.10.11-full	e3da25b13223	4 weeks ago	2.72GB			
ubuntu	latest	4e2eef94cd6b	5 weeks ago	73.9MB			
rasa/rasa-sdk	1.10.2	97eb780f0ce2	3 months ago	196MB			

- Now, run **docker-compose up** to start both rasa and action servers. This command will create an internal network, start both the servers simultaneously and interconnect them and you will be able to see the logs on the console. In order to run rasa in the background refer section 6.

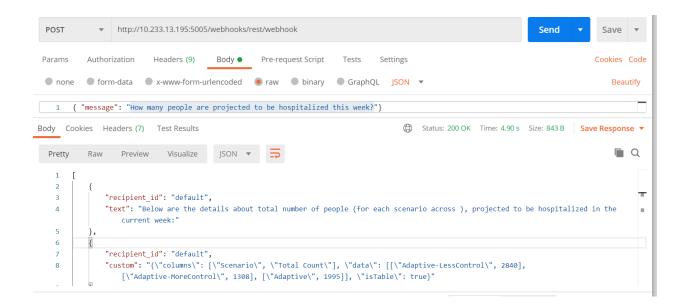

4. Verification/Validation

4.1 Validate using Post API

Now that both of the servers are up and running, we can access the docker service by making a POST API request to the docker container using the details below:

- o http://<host-ip>:5005/webhooks/rest/webhook
- Content-type: application/json
- o Body example:

{"message": "How many people are projected to be hospitalized this week?"}

4.2 Validate using curl on console

We can also verify by sending the messages to the bot from the console as shown below:

```
curl --request POST \
    --url http://localhost:5005/webhooks/rest/webhook \
    --header 'content-type: application/json' \
    --data '{
        "message": "How many people are projected to be hospitalized this week?"
    }'
```

Your chatbot should answer similar to this:

```
[{"recipient_id":"default","text":"Below are the details about total number of people (for each scenario across), projected to be hospitalized in the current week:"},

{"recipient_id":"default","custom":"{\"columns\": [\"Scenario\", \"Total Count\"],
\"data\": [[\"Adaptive-LessControl\", 2840], [\"Adaptive-MoreControl\", 1308],
[\"Adaptive\", 1995]], \"isTable\": true}"},

{"recipient_id":"default","text":"What else do you want to check about?",

"buttons":[{"payload":"\/hospitalization","title":"Hospitalization"},

{"payload":"\/occupied_beds","title":"Occupied
Beds"},{"payload":"\/about_mrdd","title":"About MRDD"}]
```

4.2 Verification from running containers

To list out all of the running containers, run the **docker ps –a** command. In the snapshot below, both the rasa-action-server and rasa server containers can be seen up and running

```
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance files]$
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance files]$
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance files]$
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance files]$ sudo docker ps -a

CONTAINER ID IMAGE COMMAND CREATED STATUS PORTS NAMES

c5a3440d93ea rasa/rasa-action-server "./entrypoint.sh sta..." About a minute ago Up About a minute 0.0.0.0:5055->5055/tcp chatbot_app_1

                                                                           models
I have no name!@c5a3440d93ea:/app$
```

5.2 chat history inside container

Chat history with chatbot is maintained in the directory named logs inside in the rasa action container, and to see the contents of the chat history we need to go to that directory and see as shown in the snapshot below.

```
rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance ~]$
[rohit kumarl@persistent.co.in@lov-hy-standoff-surveillance ~]$ sudo docker ps -a
CONTAINER ID
                                                COMMAND
                   rasa/rasa-action-server "./entrypoint.sh sta..." 3 days ago rasa/rasa:1.10.11-full "rasa run --enable-a..." 3 days ago
                                                                                                Up 3 days
                                                                                                                                                chatbot app 1
                                                                                                                                               chatbot rasa 1
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance ~]$ sudo docker exec -it 4b46e4c89dbb bash

```

5.3 stopping the containers

- To stop the compose network/servers, simply run ctrl+c; to remove all volume information, run docker-compose down command.
- And to stop the containers, run: docker stop <container-id>

6. Running docker process in background

To run the docker compose network in the background run docker-compose up -d

```
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance thursdaycall]$ sudo docker-compose down
Stopping thursdaycall_rasa_1 ... done
Stopping thursdaycall_app_1 ... done
Removing thursdaycall_rasa_1 ... done
Removing thursdaycall_app_1 ... done
Removing thursdaycall_app_1 ... done
Removing thursdaycall_app_1 ... done
[rohit_kumarl@persistent.co.in@lov-hy-standoff-surveillance thursdaycall]$ sudo docker ps -a
```

- To stop this demon process or running rasa in the background run docker-compose down
- As it is running in the background, logs of the rasa servers will not appear on the console. If you still want to see the logs of the containers run docker container logs <container-id>

7. Rasa Training

To train the Rasa for the newly added intents, or if you don't have any model available to you, then run

docker run --user 1000 -it -v \$(pwd):/app rasa/rasa:1.10.11-full train

8. Re-Deploying in the case of new commits

- If there is a new commit GitHub, then follow the instructions below:
 - Stop the currently running compose network: ctrl+c
 - Delete the old rasa-action-server image: docker rmi rasa/rasa-action-server
 - Run docker build -t rasa/rasa-action-server .
 - o Then run docker-compose up
- docker system prune command removes all the dangling images and stopped containers.
- To inspect or learn more information about a container like ipaddress,port,volume etc.

run docker inspect <container-id>

• Point to remember: Always run build and compose commands at the level where the Dockerfile and docker-compose.yml file is present.
